FEEDBACK AMPLIFIERS

The equation of gain of the feedback
amplifier, with positive feedback is given
by $A_f = \frac{A}{1 - A\beta}$
These are the standard equations to
calculate the gain of feedback amplifiers.

Amplifiers Feedback - Tutorialspoint

The feedback-amplifier can be defined
as an amplifier which has feedback lane
that exists between o/p to input. In this
type of amplifier, feedback is the
limitation which calculates the sum of
feedback given in the following amplifier.
The feedback factor is the ratio of the
feedback signal and the input signal.

Feedback Amplifier : Types, Topologies, and Characterstics

negative feedback around a high gain
DC amplifier would produce a circuit with
a precise gain characteristic that
depended only on the feedback used. By
the proper selection of feedback
components, operational amplifier
circuits could be used to add, subtract,
average, integrate, and differentiate.

Handbook of Operational Amplifier Applications (Rev. B)

Design to ensure stability often involves
frequency compensation to control the
location of the poles of the amplifier.
Electronic feedback loops are used to
control the output of electronic devices,
such as amplifiers. A feedback loop is

created when all or some portion of the
output is fed back to the input.

Feedback - Wikipedia

A Negative-feedback amplifier is an
electronic amplifier that subtracts a
fraction of its output from its input, so
that negative feedback opposes the
original signal.

Feedback Amplifiers Theory And Design

6.1. Why Study Feedback Theory? The
gain of all op amps decreases as
frequency increases, and the decreasing
gain results in decreasing accuracy, as
the ideal op amp assumption ($a \Rightarrow \infty$)
breaks down. In most real op amps, the
open loop gain starts to decrease before
10 Hz, so an understanding of feedback
is required to predict the closed loop
performance of the op amp.
