What this does is run the version of python that is the default for your

environment rather than the system default. However, please note that using /usr/bin/env doesn't work with CGI scripts on the CGI server because in that environment your bash or tcsh config files (eg. .bash_profile) are not invoked. In that case, you must explicitly use the full path to the proper script binary.

Flow profiles are classified by the slope of the channel (S_o), y_n , and y_c . There are five slope classifications designated by the letters C, M, S, A, and H (critical, mild, steep, adverse, and horizontal) respectively. Mild (M) if $y_n > y_c$. Steep (S) if $y_n < y_c$. Critical (C) if $y_n = y_c$.

Because the module command is an alias or shell function (see "Package Initialization" in module(1)).). When you say source runit.sh, it's like typing the module command directly into your interactive shell. But when you say ./runit.sh, you are running a new, non-interactive shell. Non-interactive shells generally do not have the standard

aliases and shell functions set up.

ZFS (old: Zettabyte file system) combines a file system with a volume manager. It began as part of the Sun Microsystems Solaris operating system in 2001. Large parts of Solaris – including ZFS – were

published under an open source license
as OpenSolaris for around 5 years from

2005, before being placed under a
closed source license when Oracle
Corporation acquired Sun in 2009/2010.
