In this model, the removal of a penny or a cube corresponds to the decay of a radioactive nucleus. The chance that a particular radioactive nucleus in a sample of identical nuclei will decay in each second is the same for each second that passes, just as the chance that a penny would come up tails was the same for each toss ($1/2$) or the chance that a cube would come up red was

the same for each toss ($1/6$).

1. The initial decay rate is very fast, but the decay rate decreases over time. 2. Due to randomness, the last couple of radioactive atoms may take a long time before they become nonradioactive. 3. The pattern becomes very predictable. 4. Only a few radioactive nuclei are left to decay, so fewer and fewer atoms decay. 5.

Description: With the Half-Life Laboratory, students gain a better understanding of radioactive dating and half-lives. Students are able to visualize and model what is meant by the half-life of a reaction. By extension, this experiment is a useful analogy to radioactive decay and carbon dating. Students use M&M's (or pennies and puzzle pieces) to demonstrate the idea of radioactive decay.
