There are two distinct criteria by which
researchers evaluate their measures:
reliability and validity. Reliability is
consistency across time (test-retest
reliability), across items (internal
consistency), and across researchers
(interrater reliability). Validity is the

extent to which the scores actually represent the variable they are intended to.

Another way of putting the same statement is that reliability is a necessary condition but not a sufficient condition for validity. The validity of measurement can be viewed broadly in two ways: internal validity and external validity. Internal validity seeks to answer whether a difference exists at all in any given comparison. It asks whether or not an apparent difference can be attributed to the same measurement artifact.
