"2D Game Collision Detection" is a must for everybody who wants to implement 2D collisions, especially if you have no clue how collision detection is done. The concepts are well explained by many code examples and illustrations. As said, it was way easier to start with this book than to work through all the articles (mainly on 3D) I've found online.

2D Game Collision Detection: An introduction to clashing ...

Algorithms to detect collision in 2D games depend on the type of shapes that can collide (e.g. Rectangle to Rectangle, Rectangle to Circle, Circle to Circle). Generally you will have a simple generic shape that covers the entity known as a "hitbox" so even though collision may not be pixel perfect, it will look good enough and be performant across multiple entities.

Figure 1: “Bomberman” is a “Grid-based” 2D platform game originally released in 1983. The “Pixel Colour” Collision Detection Technique. This technique was originally invented to take advantage of graphics cards capable of reproducing a limited number of colour combinations (8 or 16 colour combinations). Under this technique, all the background elements in the game environment were to be plotted in one colour, while all other game elements in other colours of choice.

Collision Detection (2D Platform Games)

Collision detection. In-Practice/2D-Game/Collisions/Collision-detection. When trying to determine if a collision occurs between two objects, we generally do not use the vertex data of the objects themselves since these objects often have complicated shapes; this in turn makes the collision detection complicated.

LearnOpenGL - Collision detection

Collision detection in 2D graphics is fairly straight-forward. You are normally trying to see whether two rectangular areas are in any way touching or overlapping each other. The rectangles to test for overlapping are the vertical and horizontal extents of the two bitmap images you want to perform collision detection on.

To kick this all off we want to create a collision detection function that will loop through all the bricks and compare every single brick's position with the ball's coordinates as each frame is drawn. For better readability of the code we will define the b variable for storing the brick object in every loop of the collision detection:
