Infrared Preheating Of Powder Coatings

Powder coating's unique characteristics lend themselves well to infrared heating. Powder coating is a finishing method that offers significant performance and economic advantages, and is a solution to current and anticipated environmental regulations.

IR Heating for Powder Coatings Application and Curing Process

Infrared can provide process heat for panel forming, preheating, drying, curing of coatings, and many other uses. Careful adjustment of the infrared emitters as to wavelength, shape and power output to the properties of the product to be heated is essential to the result. Radiation precisely adjusted to the paint's absorption properties is rapidly converted into heat inside the paint, and water and other solvents evaporate, while the material and the surroundings remain cooler and are spared.

Infrared Heat for Coating and Finishing Applications

The use of electric infrared heat for curing of powder coatings has become more widely accepted in recent years. Operational advantages include faster curing times, smaller ovens, and flexibility not achievable with convection ovens.

Powder Curing Using Infrared Heating

Many coatings, paints and varnishes require heat: Water and water-based varnishes are dried, powder coating is gelled and cured. Infrared heat emitters dry water-based wet coatings especially efficiently and can considerably accelerate the melting of powder coatings. Careful adjustment of the infrared emitters as to wavelength, shape and power output to the properties of the product to be heated is essential to the result.

Industrial infrared drying of coatings, paints and varnishes

Curing With The Infrared Light 1. The objective is to maintain a constant temperature for a sufficient length of time to properly cure the powder (365° – 400° F. for translucent and specialty colors and 320° – 400° F. for standard solid colors and clears). The difference in cure time is due to the chemical make up of the powders.

Often an IR is used to preheat, followed by an IR for post-heat and pre-convection cure followed by a UV cure. Coatings have become more sophisticated and so has the drying and curing process. Infrared (IR) can be electrically powered with different wave lengths as well as gas fired.

MDF is very suitable for powder coating because of its low porosity and homogeneous surface. Curing of powder on MDF can be accomplished by infrared, or UV light in conjunction with infrared or convection ovens. Powder Coatings for Plastics Plastics need to have some kind of conductivity to be able to powder coat.

Infrared cure is gaining increased attention from coaters as a result of shorter cure cycles and the possibility of smaller floor space requirements when compared to convection oven curing. Coaters may consider IR as they try to fit new lines into limited space or in an effort to boost performance or line speed in combination with existing convection ovens.

Understanding Infrared Curing | Products Finishing

Once dried it is possible to apply powder coating. The most effective method is the pre-meating by IR lamps on both panel's sides, whose temperature must be about 90°C once out from infrared oven. The coating of the substrate must take place within 1 or 2 minutes from the preheating process using a tribo or crown spray gun.

Electrostatic powder paint is heated before the paintwork. The advantage of this system: - Time is wasted during the staining process in complex materials. Materials are passed through an infrared preheater to a specific temperature. The staining process is easier on heated surfaces. The same applies to materials with a flat surface.

Whereas the infrared radiation concentrates on the innermost coating layers and then the heat goes back to surface: the result is an extremely homogeneous finishing, without defects, as infrared waves penetrate the paint surface and heat the coating layer leaving the external surface porous enough to let solvents and water to get out before surface curing.

Powder coating is a type of coating that is applied as a free-flowing, dry powder.Unlike conventional liquid paint which is delivered via an evaporating solvent, powder coating is typically applied electrostatically and then cured under heat or with ultraviolet light. The powder may be a thermoplastic or a thermoset polymer.
