Dynamic programming is a recursive method for solving sequential decision problems (hereafter abbreviated as SDP). Also known as backward induction, it is used to find optimal decision rules in 'games against nature' and subgame perfect equilibria of dynamic multi-agent games, and competitive equilibria in dynamic economic models.

Abstract. Empirical evaluations play an important role in machine learning.

However, the usefulness of any evaluation depends on the empirical methodology employed. Designing good empirical methodologies is difficult in part because agents can overfit test evaluations and thereby obtain misleadingly high scores. We argue that reinforcement learning is particularly vulnerable to environment ...
