comparison to find the angle of arrival (AOA) of the received signal by eight antennas circularly distributed. The characteristics of the signal are specified to provide the identification of the source in addition to the direction. The equation of (AOA) was derived by taking the ratio of signal amplitudes between each two adjacent antennas due to their associated AOA over (360) direction .The database for source identification is included also.

Direction Finding (DF) Systems DF systems use multiple antennas to determine the direction of the signal. These come in two types, "homing" DF units which tell you which way (left or right) you need to rotate the antenna to be pointing directly at the transmitter, and doppler DF units which constantly tell you which direction the signal is in, regardless of which direction the receiver is pointing.

The precision of an Adcock/Watson-Watt radio direction finding system in the computation of angles of arrival is estimated to be around 2-3 degrees 6. On the other hand, the system is not adequate for high frequency radio direction finding (HF/DF) for NVIS signals, due to the fact that the radiation patterns of the monopoles or dipoles employed have low gain for high takeoff angles 7 .

Comparison Of Radio Direction Finding Technologies|

Direction finding, or radio direction finding, is the measurement of the direction from which a received signal was transmitted. This can refer to radio

or other forms of wireless communication, including radar signals detection and monitoring. By combining the direction information from two or more suitably spaced receivers, the source of a transmission may be located via triangulation. Radio direction finding is used in the navigation of ships and aircraft, to locate emergency transmitters for
