The two most important results in fixed

point theory, are without contest, the Banach contraction principle (BCP for short) and Tarski's fixed point theorem. Since their appearances, they were subject of many generalizations, either by extending the contractive condition for the B.C.P., or changing the structure of the space itself.

The purpose of this paper is to prove some new fixed point theorem and common fixed point theorems of a commuting family of order-preserving mappings defined on an ordered set, which unify and generalize some relevant fixed point theorems.

Theorem 2.2: let (X, d) be any d -metric space and $f: X \rightarrow X$ be continuous. Assume that $(f(x), f(y)) < \max \{ (x, f(x)), (x, f(y)), (f(x), f(y)) \}$ whenever $(x, y) \neq 0$. Then f has a unique coincidence point whenever $cl O(x)$ is nonempty for some x . Proof: Write $V(x) = (x, f(x))$, $Z = \{x / V(x) = 0\}$; $O(x) =$

Introduction. We wish to summarize here some new asymptotic fixed point theorems. By an asymptotic fixed point theorem we mean roughly a theorem in functional analysis in which the existence of fixed points of a map f is proved with the aid of assumptions on the iterates f^n of f . Such theorems have

In the following theorem we are concerned with the continuity of the fixed point. Theorem 1.2. Let E be a complete metric space, and let T and $T_n (n = 1, 2, \dots)$ be contraction mappings of E into itself with the same Lipschitz constant $K < 1$, and with fixed points u and u_n respectively. Suppose that $\lim_{n \rightarrow \infty} T_n x = T x$ for every $x \in E$. Then $\lim$

In 2012, Wardowski [11] introduced a new type of contractions called F -

contraction and prove a new fixed point theorem concerning F -contractions. In this way, Wardowski [11] generalized the Banach contraction principle in a different manner from the well-known results from the literature. Wardowski defined the F -contraction as follows.

Many fixed point theorems have been proved by various authors as generalizations of the Nadler's theorem (see [6–9]). One of the general fixed point theorems for a generalized multivalued mappings appears in . The following result is a generalization of Nadler . Theorem 1.4.

Existence of fixed points in partially ordered sets has been considered recently in [1], and some generalizations of the result of [1] are given in [2–6]. Also, in [1] some applications to matrix equations are presented, in [3, 4] some applications to periodic boundary value problem and to some particular problems are, respectively, given.

In , Matthews discussed some properties of convergence of sequences and proved the fixed point theorems for contractive mapping on partial metric spaces: any mapping ϕ of a complete partial metric space $\mathcal{X}$ into itself that satisfies, where $0 \leq \phi < 1$, the inequality $\phi(\phi\alpha, \phi\beta) \leq \phi\phi(\alpha, \beta)$, for all $\alpha, \beta \in \mathcal{X}$, has a unique fixed point.

Metric fixed point theory is an essential part of mathematical analysis because of its applications in different areas like variational and linear inequalities, improvement, and approximation theory. The fixed point theorem in metric spaces plays a significant role to construct methods to solve the problems in

mathematics and sciences.

FIXED POINT THEOREMS Fixed point theorems concern maps f of a set X into itself that, under certain conditions, admit a fixed point, that is, a point $x \in X$ such that $f(x) = x$. The knowledge of the existence of fixed points has relevant applications in many branches of analysis and topology.
