Introduction. A titration, as you recall, is a convenient method of learning more about a solution by reacting it with a second solution of known molar concentration. There are a number of ways to measure the progress of a titration. In this experiment, you will use an ORP (Oxidation-Reduction Potential) Sensor to measure the electrical potential of the reaction being studied in a titration.

Redox analysis is method used by chemists in order to determine the concentration of a unknown sample. This generally includes using an indicator that determines when the unknown sample has been titrated. Redox titration happens instantly, has no side reactions and are When all the conditions are met the sample can be titrated.
