Fatigue Assessment Of Welded Joints

The main aim of the present work is to investigate, through the strain energy density method, the fatigue behaviour of high strength welded joints realised employed in hydraulic runner blades. The ge...

Local approaches to fatigue assessment are used to predict the structural durability of

welded joints, to optimise their design and to evaluate unforeseen joint failures. This standard work provides a systematic survey of the principles and practical applications of the various methods.

Fatigue Assessment of Welded Joints by Local Approaches ...

For the fatigue strength assessment of welded joints, the transverse residual stress is of interest because it is normal to the potential fatigue cracks originated from the weld toe if the joints are transversely loaded.

Fatigue crack initiation assessment of welded joints ...

An evaluation of the

fatigue crack initiation life of welded joints based on the local strain approach is carried out. The predicted results show the effect of residual stresses and agree well with published experimental results of as-welded and ultrasonic impact treated specimens, demonstrating the applicability of both approaches.

The notch stress approach for fatigue assessment of welded joints is based on the highest elastic stress at the weld toe or root. In order to avoid arbitrary or infinite stress results, a rounded shape with a reference radius

instead of the actual sharp toe or root is usually assumed.

Fatigue tests of welded joints were conducted to validate the fatigue life prediction model. Fig. 5 shows the cruciform joints that were tested to simulate the T-shape welded joint shown in Fig. 1 []. FATIGUE DESIGN OF WELDED JOINTS

Certain digester welds were not readily classifiable according to the rules of BS 7608 because of the joint geometry and the direction of the applied stress range, which changed direction during rotation of the shell. In these situations it was highly advantageous to utilise a structural stress approach.

Fatigue Assessment of Welded Joints - Deacon Engineers

Fatigue life estimation of welded joints in engineering is mainly based on the stress state of the welded joints and the stress concentration at the weld toe. Different approaches have been used for the fatigue

analysis of welded joints, such as the nominal stress approach, the hot spot stress (HSS) approach, and the local notch stress approach .

A novel structural stress approach for multiaxial fatigue ...

Fatigue is a major cause of failure, particularly in welded structures, reflecting the inherently poor fatigue performance of many welded joints [1-3] (Fig.1). This emphasises the need for due consideration of potential fatigue failure at the design stage, and for clear design guidance.

Fatigue design rules for welded structures (January 2000 ...

The design of a welded joint has a dominant

effect on fatigue life. It is therefore necessary to ensure that a structure that will experience fatigue loading in the individual joints has adequate strength. The commonest method for determining fatigue life is to refer to S/N curves that have been produced for the relevant weld designs.

Fatigue Testing - TWI

Abstract. An orthotropic steel deck (OSD) has a complicated structure, and its fatigue life is mainly determined by various welding details. Fatigue assessment of deck-to-rib welded joints under long-term train loads is an important concern for engineers. Using the stress range-number of cycles (S-N) curves

that are recommended by existing specifications, it is difficult to consider welding residual stress.

Abstract Fatigue tests and analyses were carried out to investigate fatigue strength and crack initiation point of load-carrying asymmetric double bevel cruciform welded joints. Mesh-insensitive structural stress approach was adopted to estimate high precise fatigue life
