Using this low-pass assumption, the system response can be described by one of a family of sinusoidal waveforms; in this case the system would be characterized by a sine input describing function (SIDF) $(\cdot)$ giving the system response to an input consisting of a sine wave of amplitude A and frequency ω . This SIDF is a modification of the transfer function used to characterize linear systems.

Describing function - Wikipedia

It takes three function inputs. The first takes two parameters (a binary function). The other two take only one parameter (unary functions). It returns a function that accepts a single parameter. It passes this parameter to both the unary functions. Then, it uses the binary function to combine the two results. It's easier to explain in code:

Functions A function is a relation in which each input has only one output. In the relation y , y is a function of x , because for each

input x (1, 2, 3, or 0), there is only one output y . x is not a function of y , because the input $y = 3$ has multiple outputs: $x = 1$ and $x = 2$. Examples: y is a function of x , x is a function of y .
