The mechanics of breathing. Air moves in and out of the lungs in response to differences in pressure. When the air pressure within the alveolar spaces falls below atmospheric pressure, air enters the lungs (inspiration), provided the larynx is open; when the air pressure within the alveoli exceeds atmospheric pressure, air is blown from the lungs (expiration).

Airway pressure is predicted mathematically by the equation of motion: (1) where P_{vent} is the proximal airway pressure applied by the ventilator, P_{mus} is the pressure generated by the patient's inspiratory muscles, V_T is tidal volume, C_{RS} is respiratory system compliance, R_{aw} is

airway resistance, $\dot{V}_I$ is inspiratory flow, PEEP is the PEEP set on the ventilator, and PEEP_i is intrinsic PEEP (auto-PEEP). The inertance variable, representing the effect of inertia, is assumed to be low and ...
