Three engineers from the front lines of advanced internal-combustion (IC) engine development affirmed that despite the industry's public promotion of a battery electric future for light-vehicle propulsion, committed research and development continues for IC. They said work is focused on incremental enhancement to IC efficiency and reduction in greenhouse-gas emissions, including oxides of nitrogen (NOx).

Internal combustion engines such as reciprocating internal combustion engines produce air pollution emissions, due to incomplete combustion of carbonaceous fuel. The main derivatives of the process are carbon dioxide CO₂, water and some soot—also called particulate matter (PM). The effects of inhaling particulate matter have been studied in humans and animals and include asthma, lung cancer, cardiovascular issues, and premature death.
