At Nexcelom, there are two main ways to perform CCA using an image cytometer—with cells in suspension (as in flow cytometry, which means trypsinizing adherent cells), or with adherent cells on plates (without trypsin; not an option in flow cytometry). Due to the early difficulties of automating microscopy, the flow cytometer has since the mid-1950s been the dominating cytometric device. Flow cytometers operate by aligning single cells using flow techniques. The cells are characterized optically or by the use of an electrical impedance method called the Coulter principle. To detect specific molecules when optically characterized, cells are in most cases stained with the same type of fluorochromes that are

used by image cytometers.
