 Aqueous solutions of nonionic surfactant exhibit a variety of
 phase behaviors merely by varying temperature or surfactant
 concentration. In the transition between these phases, not only
 the arrangement but also the shape of building block itself is
 changed, which makes it difficult but fascinating to clarify the
 mechanism of the phase transition in surfactant systems.

Aqueous solutions of new biodegradable triblock copolymers, poly(ethylene glycol-b-(dl-lactic acid-co-glycolic acid)-b-ethylene glycol) (PEG-PLGA-PEG), have shown to have sol-to-gel (lower transition) and gel-to-sol (upper transition) transitions as temperature monotonically increases. The lower transition is important for drug delivery application because the solution flows freely at room temperature and becomes a gel at body temperature.
