In a Hilbert space H , a sequence $\{x_n\}$ is weakly convergent to a vector $x \in H$ when. $\lim_n \langle x_n, v \rangle = \langle x, v \rangle$ for every $v \in H$. For example, any orthonormal sequence $\{e_n\}$ converges weakly to 0, as a consequence of Bessel's inequality.

The most important unbounded operators on a Hilbert space are the closed linear operators with a dense domain of definition; in particular, unbounded self-adjoint and normal operators. Between the self-adjoint and the unitary operators on a Hilbert space there is a one-to-one relation, defined by the Cayley transformation (cf. Cayley transform).

The norm $\|A\|$ of a bounded operator $A : H \rightarrow H_0$ is by definition the smallest number c for which eq. (4.2) holds. Equivalently, $\|A\| = \sup\{\|Ax\| : \|x\| = 1\}$, (4.3) see Exercise 5. It is a general fact, shown in Exercise 6, that an operator $A : H \rightarrow H_0$, where H and H_0 are arbitrary Hilbert spaces, is continuous if and only if it is bounded. Thus we have

In the field of mathematics known as functional analysis, the invariant subspace problem is a partially unresolved problem asking whether every bounded operator on a complex Banach space sends some non-trivial closed subspace to itself. Many variants of the problem have been solved, by restricting the class of bounded operators considered or by specifying a particular class of Banach

spaces. The problem is still open for separable Hilbert spaces (in other words, all the examples found of operato

The space of all bounded linear operators of finite rank (i.e. that have a finite-dimensional range) is a dense subset of the space of Hilbert–Schmidt operators (with the Hilbert–Schmidt norm). [5] The set of Hilbert–Schmidt operators is closed in the norm topology if, and only if, H is finite-dimensional.
