The rocker-bogie design has no springs or stub axles for each wheel, allowing the rover to climb over obstacles, such as rocks, that are up to twice the wheel's diameter in size while keeping all six wheels on the ground. As with any suspension system, the tilt stability is limited by the height of the center of gravity.

Abstract An analysis method to make the rocker bogie mechanism can climb up a stair is achieved in this paper. To verify whether the rocker bogie, with certain lengths of the linkages and radii of the wheels, could climb up a target stair or not, a kinematic analysis and its posture are determined.

Based on the analysis above, the rocker-bogie suspension mechanism has a greater stability margin after the high-speed traversal enhancement, making it more stable while traveling at high speed. Moreover, when the 45-degree rotation of the bogie is completed, the rover's support polygon is expanded reaching a bigger contact area. This expansion of the contact area sets the rover's Center of Mass (CM) inside a bigger track base, making it more robust against load transfers due to the ...

In cases, where the rocker bogie mechanism is being attached for a particular purpose, the design can be altered. It should also be

considered that the longer arm is designed as two times that of the shorter arm. The representation of the rocker bogie mechanism is shown in Fig. 2. Since, the mechanism has retractable wheels, it is designed such as all the wheels can distribute the load angle automatically and motion of the wheel should not remain disrupted.
