A New SiC-GaN-Based Two-Phase Interleaved Bidirectional DC-DC Converter for Plug-In Electric Vehicles.

Abstract: Wide Band Gap (WBG)

semiconductor

technologies such as

Silicon Carbide (SiC)

and Gallium Nitride (GaN) are considered as the future of power electronic devices. Especially, in hard-switching applications where switching power losses are important, GaN devices are more attractive because of their very low gate charge amount.

two-phase interleaved boost converter $n=2$, which is 180 degrees and it is shown in Fig.2. In the figure 1 it can be seen that the input current, i , for two phase interleaved boost converter is the sum of each channels inductors currents. As the two devices are phase-shifted by 180 degrees, the input current ripple produced

is the smallest.

Two-Phase, Dual Interleaved Buck-Boost DC-DC Converter for Automotive Applications. Abstract: A two-phase buck-boost converter utilizing dual interleaving is presented in this article. The dual interleaving consists of an interphase transformer (IPT) that doubles the ripple frequency together with two conventional buck-boost switching arms, mitigating the inductor ripple current and aiding to increase the power density of the converter.

Interleaved, 2-Phase NCP1632 The NCP1632 integrates a dual MOSFET driver for interleaved PFC applications. Interleaving consists of paralleling two small stages in lieu of a bigger one, more

difficult to design. This approach has several merits like the ease of implementation, the use of smaller components or a better distribution of the heating.

NCP1632 - Power Factor Controller, Interleaved, 2-Phase

The NCP1631 integrates a dual MOSFET driver for interleaved PFC applications. Interleaving consists of paralleling two small stages in lieu of a bigger one, more difficult to design. This approach has several merits like the ease of implementation, the use of smaller components or a better distribution of the heating.

NCP1631 - Interleaved, 2-Phase

Power Factor Controller

The two phase interleaved LLC resonant converter operation is made possible by enhanced control peripherals on C2000 devices, namely the type 4 PWMs, the ADCs, and comparators. This design accepts a DC input voltage between 370 volts and 410 volts, and provides 12 volts of regulated DC output voltage at a maximum output power of 500 watts or 42.5 amperes of load current.
