Flat root involute splines; Design Considerations for Involute Splines. When designing and selecting an involute spline for an application, there are several factors that designers and engineers should keep in mind to ensure optimal performance. These factors include: Thickness and the height of the teeth. The height and thickness of the teeth on a spline are calculated based on the root strength of the spline and the expected torque requirements of the application. Pressure angle of the ...

Involute Spline Size Inspection - Gear Technology

Splines with involute flanks have a very high line of contact in the nonworn condition. This reduces increase of clearance due to wear within the lifetime of the spline, compared to straight-sided splines. For these reasons the spline with involute flanks is the most frequently used connection. (See Fig. 10.)

A specific type of spline known as an "involute spline" shaft enables a manufacturer to facilitate this type of

mechanical assembly; it relies upon inwardly curving equally spaced grooves in the spline that do not display straight-sidedness or any sharp corners.

Manufacturers design these components to mesh precisely with a mated part.

Since the design of involute splines and their manufacture requires considerable knowledge, not only of the basic properties of the involute profile, but also of various other elements which affect the spline fit and the sometimes complex principles underlying

manufacturing and checking equipment, the question is frequently raised as to why the involute profile is given preference in designing splines over the seemingly simpler straight sided tooth profile.

Involute splines are available in several different pressure angles: 30 degrees, 37.5 degrees, and 45 degrees. The 30-degree splines are by far the most common, so that is what will be considered here. Splines are made with either a fillet root or a flat root at the interface of the tooth flank and the root diameter.
