The information below can be used to calculate the values of thread tolerances defined by ISO 965/1. Tolerances are written as a combination of a tolerance band, signified by an alphabetic letter (E, G, e, f, g or h, with uppercase letters signifying internal threads, and lowercase signifying external), and a tolerance class, signified by a number. Grade 6 signifies general use, with smaller numbers being used for stricter tolerance, and higher numbers being used for more loose tolerances.

ISO Metric Thread Tolerance Tables | Accu®

Size limits for standard external thread tolerance classes 6g and 4g6g apply prior to coating. The external thread allowance may thus be used to accommodate the coating thickness on coated parts. The designation of a screw thread gives the thread symbol, the nominal size, the pitch, and the thread tolerance class (Ex: M6 x 1 - 4g6g).

Tolerance is the total amount a dimension may vary and is the difference between the maximum and minimum limits. Tolerance = 0,3 mm Tolerances are represented as Tolerance Values (A) or as Direct Limits (B). Important Terms of Toleranced Parts Nominal Size is used to describe the general size of a part.
