A Hierarchical Feature Representation For Hierarchical Quality-Relevant Feature Representation for Soft Sensor Modeling: A Novel Deep Learning Strategy. Abstract: Deep learning is a recently developed feature representation technique for data with complicated structures, which has great potential for soft sensing of industrial processes. However, most deep networks mainly focus on hierarchical feature learning for the raw observed input data.

This section presents the proposed double layer encoding (DLE), pooled feature representation (PFR), and learning with sub-network nodes (LSN) strategies. In this thesis, we explore a hierarchical feature representation in which different cues can be considered for unrelated classes of sounds, allowing the use of targetted features for making fine phonetic distinctions among confusable phones. To this end, we use a DBM to discover hierarchical feature representation from neuroimaging, e.g., MRI and PET, in our work. Fig. 3 (a) shows an example of the three-layer DBM. The energy of the state $(\mathbf{v}, \mathbf{h}^1, \mathbf{h}^2)$ in the DBM is given by (8) $E_{\mathbf{v}, \mathbf{h}^1, \mathbf{h}^2} = -\mathbf{v}^T \mathbf{W}^1 \mathbf{h}^1 - \mathbf{h}^1{}^T \mathbf{W}^2 \mathbf{h}^2$ where $\mathbf{W}^1 = W_{ij}^1 \in \mathbb{R}^{D \times F^1}$ and $\mathbf{W}^2 = W_{jk}^2 \in \mathbb{R}^{F^1 \times F^2}$ are, respectively, symmetric connections of $(\mathbf{v}, \mathbf{h}^1)$ and $(\mathbf{h}^1, \mathbf{h}^2)$, and $\Theta = \{\mathbf{W}^1, \mathbf{W}^2\}$.

In the present paper “Top-down sharpening of hierarchical visual feature representations,” the authors use deep neural network (DNN) hierarchical representations of fMRI voxel data during visual stimulation with several levels of blurred images and compares such representations with those for original (non-blurred) images and found that DNN representations of blurred images were veered towards those of non-blurred and concludes that this is due to ‘sharpening’ by ‘top-down ...

After finding latent and shared feature representations of the paired patches from the trained MM-DBM, we construct an image-level classifier by fusing multiple classifiers in a hierarchical manner, i.e., patch-level classifier learning, mega-patch construction, and a final ensemble classification.

A Hierarchical Feature Representation For Phonetic

The hierarchical architecture of the biological neural system inspires deep learning architectures for feature learning by stacking multiple layers of learning nodes. These architectures are often designed based on the assumption of distributed representation : observed data is generated by the interactions of many different factors on multiple levels.

Finally, a simple but efficient extreme learning machine classifier is employed to get the classification results. To some extent, the proposed method is a combination of MFF and FE: instead of feature fusion or single feature extraction, we use an ensemble strategy to provide a hierarchical feature representation for the hyperspectral data.

Specifically, we use Deep Boltzmann Machine (DBM) (2), a deep network with a restricted Boltzmann machine as a building block, to find a latent hierarchical feature representation from a 3D patch, and then devise a systematic method for a joint feature representation from the paired patches of MRI and PET with a multimodal DBM.

Each segmentation component is represented by the set of feature vectors that fall into it: the component is encoded by a spatial grid of aggregated feature vectors. The aggregated feature vector of each grid cell is computed by a component-wise max pooling of the feature vectors centered on all the pixels that fall into the grid cell.
