Effective Field Theory and Ultracold Atoms

Ultracold atoms have a wide range of applications - including improved atomic clocks, gyroscopes, and sensing of gravitational and magnetic fields - because they are

extremely sensitive to external fields and forces. The majority of ultracold atom experiments use a 2-stage arrangement: atoms are first cooled from room temperature to ~ 1 millikelvin in a vacuum chamber, then are transported to a neighbouring chamber where they are further cooled and probed.

Research | Ultracold Quantum Matter Lab

The formation of ultracold molecules is a new and rapidly developing area in the physics of quantum degenerate gases. The aim of our research is to theoretically understand the dynamics of the association of molecules and its interplay with the bulk

motion in trapped Bose-Einstein condensates and quantum degenerate two component Fermi gases.

Theoretical Physics of Molecules and Quantum Systems ...

This thesis reports on a variety of calculations on cold and ultracold scattering, with a broad theme of how best to consider and understand complex systems in simple ways. Firstly, we investigate quantum defect theory. We demonstrate that it is not only an excellent model for simple systems, but can also provide simple predictions of the of possible behaviours for complex systems, in particular for a model of collisional losses.
