Evidently, the oscillation at frequency ω_0 corresponds to the two masses moving exactly in phase, so the coupling does not come into play, while the oscillation at frequency $\omega_0 + 2\omega$ has the two masses moving exactly out of phase.

The general motion of the system is a superposition of these two normal modes.

2) $F(t) = \cos(\omega t + \theta) = m \ddot{x}$ (note: general part cancels, by design; needed to accommodate any possible initial conditions. Particular part matches RHS)
 So the motion has 2 parts: 1. A free oscillation, caused by initial conditions.

is an influence within or upon an oscillatory system that has the effect of reducing, restricting or preventing its oscillations. In physical systems, damping is produced by processes that dissipate the energy stored in the oscillation.
