Busbar Protection Scheme Based On

What is Busbar Protection? Busbar protection is a protection scheme meant to protect the busbar from electrical fault. Various feeders are connected to a busbar through circuit breaker in any of the bus configuration viz. Double Busbar arrangement or one and half breaker scheme. The main purpose of this busbar is to increase the reliability of power system by maintain the evacuation of power in case of tripping of any feeder due to fault.

Busbar Protection Scheme Explained | Electrical Concepts

The CTs arrangement is shown in the figure for 4 CTs method in breaker and half scheme: For feeder protection both bus CT and opposite tie breaker CT will be summated and connected to the relay (CT1 & CT4 for feeder-1, CT2 & CT3 for feeder-2). Bus side CTs will be utilized for bus bar protection. There is no uncovered zone in 4 CTs method.

Principles and applications of busbar protection schemes

...
The scheme of busbar protection, involves, Kirchoff's current law, which states that, total current entering an electrical node is exactly equal to total current leaving the node. Hence, total current entering into a bus section is equal to total current leaving the bus section. The principle of differential busbar protection is very simple.

The paper presents a protection scheme based on fault transient analysis. It also explicitly describes the concept of integrated protection unit and the IEC61850-9-2 process bus concept. The effectiveness of the protection principle is tested for a converter based doubly fed induction generator wind turbine.

1. System protection used to cover busbars. The system that is used to cover busbar protection consists of overcurrent or distance protection. Making use of this system the busbar will be inherently protected. This technique or method is applied to simple distribution systems by implementing overcurrent protection.

Busbar protection schemes for distribution substations | EEP

In , a busbar protection scheme based on wave impedance was proposed. The busbar fault zone was detected by analysing the polarity and magnitude of the current travelling wave of each branch of the busbar. proposed a busbar protection principle based on a wavelet transform and a travelling wave polarity comparison. The method used the wavelet transform to extract the polarity of the initial travelling wave current and distinguished internal and external faults by comparing the current ...

The protection concept for all bus differential relay schemes is based on Kirchhoffs First Law that the sum of all currents at the common point of connection, at any instant in time, is equal to zero. In particular, for bus differential protection this means that the sum of currents that flow from the Page 4

BUSBAR PROTECTION - BUSBAR DIFFERENTIAL: BEST PRACTICE AND ...

1. Differential Protection: The basic method for busbar protection is the differential scheme in which currents entering and leaving the bus are totalised. During normal load condition, the sum of these currents is equal to zero. When a fault occurs, the fault current upsets the balance and produces a differential current to operate a relay.

The principle operation of differential bus bar protection depends

on the Kirchhoff current law, which states that the sum of currents that enter the bus equals the sum of currents that leave bus; on the other hand, it can be expressed as the vector sum of all currents entering and leaving the bus bar equals zero as in : $(1) \sum I^{-j} = 0$. where j is the branch connected to bus bar, I^{-j} is the vector current of j branch which is measured by current transformer CT as in Fig. 2(a).
