Signal conditioning is the technique of making a signal from a sensor or transducer suitable for processing by data acquisition equipment. For example, if you were measuring a voltage signal smaller than a few millivolts, you might need to amplify it. If you had a signal contaminated with noise you could filter it. Proper signal conditioning is essential in getting an accurate measurement of your signal.

2. Pressure Sensor Signal Conditioner. Pressure sensing works by monitoring the strain or stress experienced by a bridge. The pressure signal conditioner excites the bridge by providing constant voltage and amplifying the output signals. The

output of the pressure sensor varies in millivolts along with high common-mode signals.

Renesas' sensor signal conditioner ICs typically interface with two main sensor types: resistive bridges and differential capacitors. For each sensor type, further specialization allows selecting the optimal balance between price and performance for the required operating voltage and temperature range, gain, resolution, input/output format, and qualification level.
