Some algorithms need a way of performing off-line computation, while other algorithms are able to do all their calculations on the sensor nodes themselves. Localization is still a new and exciting field, with new algorithms, hardware, and applications being developed at a feverish pace; it is hard to say what techniques and hardware will be prevalent in the end.

A computer representation of a tree with nodes is achieved by an array of records, each record consisting of several data fields, pointers to children and a pointer to the parent. All pointers to empty trees are nil. The number of

any trees with  $n$  nodes is  $B(n, t) = \frac{(t n)!}{(n! (t n - n)! ((t - 1)n + 1))}$  (cf. [19, 42]).
