Radiation Exposure And Image Quality

The largest contribution to radiation exposure to the population as a whole arises from diagnostic X-rays. Protecting the patient from radiation is a major aim of modern health policy, and an understanding of the relationship between radiation dose and image quality is of pivotal importance in optimising medical

diagnostic radiology.

Radiation Exposure and Image Quality in X-Ray Diagnostic

...

Introduction. Diagnostic X-rays are the largest contributor to radiation exposure to the general population, and protecting the

patient from radiation damage is a major aim of modern health policy. Once the decision has been taken to use ionising radiation for imaging in a particular patient, it is necessary to optimize the image acquisition process taking into account the diagnostic quality of the images and the radiation dose to the patient.

Radiation Exposure and Image Quality in X-Ray Diagnostic

...

At 80 mAs, a minor reduction in image quality was perceived, but the radiologists in this study did not generally consider that the difference in image quality would justify any increase in patient radiation exposure. Only on CT images obtained at 40 mAs was unambiguous evidence seen that the deterioration in image quality relative to the reference image was sufficient to warrant additional radiation exposure.

Radiation Exposure and Image Quality in Chest CT ...

Generation of high quality radiographic images is multi-factorial, depending on the performance of the imaging equipment, patient-related factors (shape and size), type of image receptors, the radiographic technique used and staff experience (Moores et al., 1987) Stieve et al. (1993) and Moores et al., 1987 believes that, the process of balancing between the radiation exposure and the radiography quality outcome for diagnostic purposes involves three aspects of the imaging process: selection ...

Both image quality and radiation dose are affected by a number of parameters, knowledge of which permits scientifically based

decision making. The authors of this second edition of Radiation Exposure and Image Quality in X-ray Diagnostic Radiology have spent many years studying the optimization of radiological imaging.

Radiation Exposure and Image Quality in X-Ray Diagnostic ...

This relationship must be considered when trying to reduce radiation exposure by use of low-kilovolt scanning and to maintain image quality. 24,27 The higher noise level in low-kilovolt scans will not be completely compensated by the higher iodine attenuation; therefore, additional adjustments of the tube current (milliamperage setting) are necessary. Optimal manual adjustment of these parameters is complex, which prevented low-kilovolt scanning from general use until now.

Image quality and radiation dose Radiation dose is one of the most significant factors determining CT image quality and thereby the diagnostic accuracy and the outcome of a CT examination. Radiation dose should only be reduced under the condition that the diagnostic image quality is not sacrificed.

Radiation dose in CT scans and image quality

Radiation dose was based on CT dose index, image noise, and iodine contrast and measured with constant and variable tube currents that were age appropriate for each tube voltage. Radiation dose and image noise and contrast were compared in

round and oval 24-cm phantoms.

These new, well-defined, streamlined protocols for imaging patients using CCTA emphasise both optimisation of image quality and minimisation of patient's exposure to radiation dose .
