We are working to characterize microorganisms in natural and engineered ecosystems, and to understand their roles in biogeochemical cycling. Our researchers work on terrestrial and aquatic systems, including deep-ocean trenches, chalk streams, and artificial mesocosms. Current topics include the unravelling the importance of microbes in bio-methane production, the decomposition of plastic by bacteria, and the contribution of bacteria to the cycling of carbon and nitrogen in the open oceans.

Microbial ecology is the study of this interaction between microorganisms and their environment, and arguably represents one of the most important areas of biological research. Yet for many years our study of microbial flora was severely limited: the primary method of culturing microorganisms on media allowed us to study only between 0.1 and 10% of the total microbial flora in any given environment.

The field of microbial ecology has been revolutionized in the past two decades by the introduction of

molecular methods into the toolbox of the microbial ecologist. This molecular arsenal has helped to unveil the enormity of microbial diversity across the breadth of the earth's ecosystems, and has revealed that we are only familiar with a very small minority of the organisms that carry out key microbial functions in diverse habitats.

Microbial ecology - Wikipedia

Abstract. Microorganisms are ubiquitous and represent a taxonomically and functionally diverse component of freshwater environments of significant ecological importance. The bacteria, archaea, and microbial eukarya in freshwater systems support a range of ecosystem processes and functions, including mediating all major biogeochemical cycles, and therefore regulate the flow of multiple ecosystem services.
