Genetic And Evolutionary Algorithms

A genetic or evolutionary algorithm applies the principles of evolution found in nature to the problem of finding an optimal solution to a Solver problem. In a "genetic algorithm," the problem is encoded in a series of bit strings that are manipulated by the algorithm; in an "evolutionary algorithm," the decision variables and problem functions are used directly.

In computational intelligence (CI), an evolutionary algorithm (EA) is a subset of evolutionary computation, a generic

population-based metaheuristic optimization algorithm. An EA uses mechanisms inspired by biological evolution, such as reproduction, mutation, recombination, and selection. Candidate solutions to the optimization problem play the role of individuals in a population, and the fitness function determines the quality of the solutions (see also loss function).

The area of Genetic and Evolutionary Computation has seen an explosion of interest in recent years. Methods based on the variation-selection loop of Darwinian natural evolution have been successfully applied to a whole range of research areas. The Genetic and Evolutionary Computation Book Series

publishes research monographs, edited collections, and graduate-level texts in one of the most exciting areas of Computer Science.

Genetic and Evolutionary Computation

Genetic Algorithms are algorithms that are based on the evolutionary idea of natural selection and genetics. GAs are adaptive heuristic search algorithms i.e. the algorithms follow an iterative pattern that changes with time. It is a type of reinforcement learning where the feedback is necessary without telling the correct path to follow.
