a Basics Principles of Remote Sensing

Active And Passive Microwave Remote

Active and Passive Microwave Remote Sensing. Active remote sensing systems are not dependent on the Sun's EMR or the thermal properties of the Earth. Active remote sensors create their own

electromagnetic energy that: 1. is transmitted from the sensor toward the terrain (and is largely unaffected by the atmosphere), 2. interacts with the terrain producing a backscatter of energy, and 3. is recorded by the remote sensor's receiver.

Active and Passive Microwave Remote Sensing

Active Microwave Remote Sensing: It operates in the microwave region and RADAR is the example of it. On this type, sensor emits microwave (radio) signal to the specific target. Few terms used in Active Sensors: Majority of active sensors operate in the microwave portion on the electromagnetic spectrum.

A to Z About Active and Passive Remote Sensing

This type of remote sensing is called active microwave, or radar. This same technology is used to track aircraft, ships, and speeding automobiles. As with passive microwave energy, the physical properties of objects at the Earth's surface determine the amount and characteristics of microwave radiation bounced back to the sensor.

Most recently, combined passive/active microwave techniques have been proposed as an alternative to surface variable retrievals such as near-surface soil moisture and temperature Bindlish & Barros, 2002, Wilson et al., 2001, Njoku et al., 2000, Wigneron et al., 1999, Chauhan, 1997. Remotely sensed passive (radiometer) and active (radar) microwave signatures have certain amount of physical information in common, but each sensor is distinctly sensitive to different surface properties.

The crystalline structure of ice typically emits more microwave energy than the liquid water in the

ocean. Thus, sensors that detect passive microwave radiation can easily distinguish sea ice from ocean. A major drawback to measuring passive microwave radiation is that the energy level is quite low.

Microwave sensing encompasses both active and passive forms of remote sensing. As described in Chapter 2, the microwave portion of the spectrum covers the range from approximately 1cm to 1m in wavelength. Because of their long wavelengths, compared to the visible and infrared, microwaves have special properties that are important for remote ...

Active and passive microwave signals from the Earth co-vary depending on the scattering and emission characteristics of natural media (e.g. soil, vegetation snow or ice). Based on such characteristic covariations, signals from different sensors can be combined for joint data analyses

and retrieval of Earth system properties such as soil or plant moisture.

There are two types of remote sensing instruments—passive and active. Passive instruments detect natural energy that is reflected or emitted from the observed scene. Passive instruments sense only radiation emitted by the object being viewed or reflected by the object from a source other than the instrument. Reflected sunlight is the most common external source of radiation sensed by passive instruments.
