In a microscale titration, the exact number of drops of sodium hydroxide of known molarity needed to react completely with a measured number of drops of vinegar will be counted. When all of the acid has been neutralized, the number of moles of acid (moles a) must be equal to the number of moles of base (moles b), as shown in Equation 2. moles a = moles b

Microscale Titration Post Lab Answers

I tend to enjoy acid base titrations for several reasons. First, students get to work with burettes, acids, bases and they see a nice "color change" when they reach an endpoint. Many times, students who tend to struggle with pen and paper testing excel at the "hands-on" approach. Titrations also dovetail well with stoichiometry which provides a nice review of information closer to the end of ...

The titration lab also involved indicators. Indicators are substances which undergoes a color change in the pH interval of the equivalence point, allowing physical observation of pH change. Most indicators are weak acids, so protons shift from acid to conjugate base. As the proton shifts, the color changes.

Titration is an analytical method used to determine the exact amount of a substance by reacting that substance with a known amount of another substance. The completed reaction of a titration is usually indicated by a color change or an electrical measurement. An acid/base neutralization reaction will yield salt and water.

Using the values above, if titration requires 1.02 mmol of NaOH to reach the endpoint, the sample must also contain 1.02 mmol of acetic acid. If the volume of the vinegar used is 8.05 mL, the molarity of acetic acid is 1.02

mmol / 8.05 mL = 0.127 M. In this experiment, a carefully measured volume of vinegar (V analyte) is placed into a beaker and the mass determined.
