Fred and Theresa Holtzclaw. Chapter 9: Cellular Respiration and Fermentation. 1. Explain the difference between fermentation and cellular respiration.

Fermentation is a partial degradation of sugars or other organic fuel that occurs without the use of oxygen, while cellular respiration includes both aerobic and anaerobic processes, but is often used to refer to the aerobic process, in which oxygen is consumed as

a reactant along with the organic fuel.

#### **Respiration:**

- In cellular respiration, glucose and other organic molecules are broken down in a series of steps
- Electrons from organic compounds are usually first transferred to NAD<sup>+</sup>, a coenzyme
- As an electron acceptor, NAD<sup>+</sup> functions as an oxidizing agent during cellular respiration
- Each NADH (the reduced form of NAD<sup>+</sup>) represents stored energy that is tapped to synthesize ATP
