Parallel-flow and Counter-flow Heat Exchanger Heat exchangers are typically classified according to flow arrangement and type of construction. The simplest heat exchanger is one for which the hot and cold fluids move in the same or opposite directions. This heat exchanger consists of two concentric pipes of different diameters.

What is Parallel-flow and Counter-flow Heat Exchanger ...

A heat exchanger is a device, which transfers thermal energy between two fluids at different temperatures. In most of the thermal engineering applications, both of the fluids are in motion and the main mode of heat transfer is convection. Examples are automobile radiators, condenser coil in the refrigerator, air conditioner, solar water heater, chemical industries, domestic boilers, oil coolers in a heat engine, milk chillers in pasteurizing plant.

Heat Exchanger - Learn Mechanical Engineering

In the most commonly used type of heat exchanger, two fluids of different temperature flow in spaces separated by a tube wall. They transfer heat by convection and by conduction through the wall. This type is referred to as an "ordinary heat exchanger," as compared to the other two types classified as "regenerators" and "cooling towers."

A counterflow heat exchanger has the hot fluid entering at one end of the heat exchanger flow path and the cold fluid entering at the other end of the flow path. Counter flow is the most common type of liquid-liquid heat exchanger, because it is the most efficient. A double pipe heat exchanger is usually operated as a counter flow heat exchanger, as shown in the diagram at the left.

Heat Exchanger Flow: Cross flow, Parallel flow, Counter ...

In recuperative type of heat exchangers, cold and hot fluid flow through the unit without mixing with each other. The transfer of heat occurs through the metal wall. Examples of recuperative heat exchangers are boilers, heaters, coolers, vaporizers, condensers etc.

Classification of Heat Exchangers - Chemical Engineering World

Plate heat exchangers use thin plates of metal to separate the two fluids. The fluids generally flow in opposite directions to improve the heat transfer. The heat of the hottest fluid is convected onto the plate wall and then conducted through to the other side.

HVAC Heat Exchangers Explained - The Engineering Mindset

There are three primary classifications of heat exchangers according to their flow arrangement. In parallel-flow heat exchangers, the two fluids enter the exchanger at the same end, and travel in parallel to one another to the other side. In counter-flow heat exchangers the fluids enter the exchanger from

opposite ends.

Heat Exchanger and its types - Engineering Solutions

The volumetric flow rate in a heating system can be expressed as. $q = h / (c_p \rho \Delta t)$ (1) where. q = volumetric flow rate (m^3/s) h = heat flow rate (kJ/s , kW) c_p = specific heat ($kJ/kg^\circ C$) ρ = density (kg/m^3) Δt = temperature difference ($^\circ C$) This generic equation can be modified for the actual units - SI or imperial - and the liquids in use.

Heating Systems Flow Rates - Engineering ToolBox

The design of a heat exchanger is an exercise in thermodynamics, which is the science that deals with heat energy flow, temperature, and the relationships to other forms of energy.

Understanding Heat Exchangers - Types, Designs ...

The most common arrangements for flow paths within a heat exchanger are counter-flow and parallel flow. A counter-flow heat exchanger is one in which the direction of the flow of one of the working fluids is opposite to the direction to the flow of the other fluid. In a parallel flow exchanger, both fluids in the heat exchanger flow in the same direction.

Parallel and Counter Flow Designs Heat Exchangers ...

In power engineering, common applications of heat exchangers include steam generators, fan coolers, cooling water heat exchangers, and condensers.
