Page 2 of 6 pH and $[H^+]$ Calculations for Strong Acids and Bases
 By definition, strong acids and bases are 100% ionized in water solution. Ionization of a strong acid gives rise to H^+ ions, and ionization of a strong base produces OH^- ions. The equilibrium constant for a strong acid or strong base is undefined, since the reaction the ionization is complete.

So, the pH = 2.64. The pH is slightly less acidic, because the concentration of H⁺ in the more dilute system is lower. The percent ionization = $([H^+] / [HF]) \times 100 = \{ (2.3 \times 10^{-3}) / (0.010) \} \times 100 = 23.0\%$. Although the [H⁺] is lower, the percent ionization is much higher in the dilute acid.

 $pOH = -\log(2.00 \times 10^{-2}) = 1.70$; and $pH = 14.00 - 1.70 = 12.30$. Note that this result is the same as for the strong acid-strong base titration example provided, since the amount of the strong base added moves the solution past the equivalence point.

During an acid-base titration, an acid with a known concentration (a standard solution) is slowly added to a base with an unknown concentration (or vice versa). A few drops of indicator solution are added to the base. The indicator will signal, by color change, when the base has been neutralized (when $[\text{H}^+] = [\text{OH}^-]$).

For all acid-base equilibrium calculations that are properly set up, these roots will be real, and only one will be positive; this is the one you take as the answer. Approximations, judiciously applied, simplify the math. We have already encountered two of these approximations in the examples of the preceding section:

V_{acid} = volume of the acid. M_{base} = concentration of the base.
 V_{base} = volume of the base. This equation works for acid/base reactions where the mole ratio between acid and base is 1:1. If the ratio were different, as in $\text{Ca}(\text{OH})_2$ and HCl , the ratio would be 1 mole acid to 2 moles base. The equation would now be:
