Geometrical And Physical Optics

Geometrical and physical optics Dispersion and polarization. In his 1666 experiment, shown in the figure,

Newton discovered what is now called dispersion or dispersive refraction. He showed that a light beam is bent, or refracted, as it passes from one medium to another—e.g., from air into glass. The natures of the two media as well as the wavelength of the light involved determine the degree of refraction, with shorter wavelengths bending more than longer wavelengths.

Geometrical and physical optics : Longhurst, R. S ...

When the size of the physical and optical objects of a system are much larger than the wavelength of the light (or as $\lambda \rightarrow 0$), we are in the realm of geometrical optics. Optical systems in which the wave nature of light must be taken into account (interference, diffraction) are called physical optics. Of course, every real system experiences diffraction effects, so geometric optics is necessarily an approximation.

In physics, physical optics, or wave optics, is the branch of optics that studies interference, diffraction, polarization, and other phenomena for which the ray approximation of geometric optics is not valid. This usage tends not to include effects such as quantum noise in optical communication, which is studied in the sub-branch of coherence theory.

Geometrical and Physical Optics by Longhurst, R S

Classical optics is divided into two main branches: geometrical (or ray) optics and physical (or wave) optics. In geometrical optics, light is considered to travel in straight lines, while in physical optics, light is considered as an electromagnetic wave.
