A corneal transplant may be rejected by your immune system. This happens in 6-10% of DSAEK recipients in the first two years after transplantation and can cause graft failure. It can often be reversed if anti-rejection medication is started promptly but rejection remains a possibility in your lifetime. The rejection rate in DMEK appears to be lower than in DSAEK. Graft failure

variations known as DSAEK or DMEK)

Descemet's stripping automated endothelial keratoplasty (DSAEK) and Descemet's membrane endothelial keratoplasty (DMEK) are partial thickness corneal transplants performed to replace the endothelium (the innermost portion of the cornea).

Partial thickness corneal transplant. Sometimes the front and middle layers of the cornea are damaged. In this case, only those layers are removed. The endothelial layer, or the thin back layer, is kept in place. This transplant is called deep anterior lamellar keratoplasty (DALK) or partial thickness corneal transplant. DALK is commonly used to treat keratoconus or bulging of the

cornea. Healing time after DALK is shorter than after a full corneal transplant.

DSEK is indicated in patients with diseased or damaged endothelia as with Fuchs Dystrophy, pseudophakic corneal edema, or iridocorneal endothelial syndrome. In cases where only the back-most part of the cornea is diseased or damage, it isn’t always necessary to perform a full-thickness transplant.

DSEK vs. DMEK: an overview of Endothelial Keratoplasty

DMEK and DSAEK are both advanced surgeries for Fuchs’ dystrophy and other causes of corneal endothelial failure, during which a very thin layer of new cells is placed inside the eye. The new

cell layer is held in place by an air/gas bubble that supports the new layer and gradually disappears over 3-5 days.
