The dynamic design analysis method is a US Navy-developed analytical procedure for evaluating the design of equipment subject to dynamic loading caused by underwater explosions. The analysis uses a form of shock spectrum analysis that estimates the dynamic response of a component to shock loading caused by the sudden movement of a naval vessel. The analytical process simulates the interaction between the shock-loaded component and its fixed structure, and it is a standard naval engineering proce

The main difference between static and dynamic analysis is TIME! If the load is applied so slowly, that inertia effects won't play a role, all you need is static analysis. Dynamic analysis handles impacts and other "fast" happening situations, but also vibrations (which happen in time).

The difference between static and dynamic analysis | Enterfea

Structural dynamics is a type of structural analysis which covers the behavior of a structure subjected to dynamic loading. Dynamic loads include people, wind, waves, traffic, earthquakes, and blasts. Any structure can be subjected to dynamic loading. Dynamic analysis can be used to find dynamic displacements, time history, and modal analysis. Structural analysis is mainly concerned with finding out the behavior of a physical structure when subjected to force. This action can be in the form of l
