Geometric Analysis of Hyperbolic Differential Equations ...

Differential geometry is a mathematical discipline that uses the techniques of differential calculus, integral calculus, linear algebra and multilinear algebra to study problems in geometry. The theory of plane and space curves and surfaces in the three-dimensional Euclidean space formed the basis for development of differential geometry during the 18th century and the 19th century.

In regards to mutual length contraction, 2-9 illustrates that the primed and unprimed frames are mutually rotated by a hyperbolic angle (analogous to

ordinary angles in Euclidean geometry). [note 8] Because of this rotation, the projection of a primed meter-stick onto the unprimed x -axis is foreshortened, while the projection of an unprimed meter-stick onto the primed x' -axis is likewise ...

In mathematics, hyperbolic geometry

(also called Lobachevskian geometry or Bolyai-Lobachevskian geometry) is a non-Euclidean geometry. The parallel postulate of Euclidean geometry is replaced with: . For any given line R and point P not on R , in the plane containing both line R and point P there are at least two distinct lines through P that do not intersect R .
