The azeotropic vapor distills at 90.7°C and condenses and runs down to the sidearm of the 3-way connector; this sidearm is closed with a cork. The layers separate, with the denser water layer remaining in the sidearm while the lighter n-butyl acetate/ethanol layer (organic layer) runs down into the reaction flask. As soon as the theoretical quantity of water has collected, the reaction is over and the product in the flask should be ester of high purity.
