The curve traced out by the object subject to a constant force in one direction is a parabola. The projectile motion of a particle can be studied by splitting the motion into horizontal and vertical components, and considering the forces that move the object separately. Figure 2 explains a scenario where projectile motion happens. The horizontal force acting on the object tends to move the object horizontally and the gravitational force acting on the object tends to move the object downwards.

Projectile motion must obey Newton’s Second Law force = mass×acceleration. Since air resistance is assumed negligible, the only force on the projectile is its weight which acts vertically downward at every point of the path. To give the position of the projectile at any time t some coordinates are needed. A convenient origin is the point O at

Before attempting to answer projectile motion questions, it is important to understand what a projectile is. A projectile is an object which is moving under its own inertia - in simpler terms, the only force acting upon it is gravity. For this example, the following 'suvat' equations are used: Eqn 1) v = u + a*t. Eqn 2) s = ut+0.5at ²
