Geology Of Sicily An Introduction

The geology of Sicily records the collision of the Eurasian and the African plates during westward-dipping subduction of the African slab since late Oligocene. Major tectonic units are the Hyblean foreland, the Gela foredeep, the Apenninic-Maghrebian orogen, and the Calabrian Arc. The orogen represents a fold-thrust belt that folds Mesozoic carbonates, while a major volcanic unit is found in an eastern portion of the island. The collision of Africa and Eurasia is a retreating subduction system,

Structural Geology Stratigraphic Architecture & Trap Styles

Geology The geology of Sicily is similar to that of other Mediterranean islands, which were conditioned by the slow contraction of the vast ocean between Africa and Eurasia. In the last 50 million years, this process has pushed the predominantly limestone sea bed of the Cretaceous period toward the surface, causing the formation of mountain and hill ranges.

The Lay of the Land in Sicily | Frommer's

Description. This 5-day field trip offers an intensive and robust multidisciplinary approach to techniques and analysis on the field (regional geology, geodynamics, structural geology, stratigraphy, facies analysis and petroleum geology). Set on the famous Sicily Island, one of the most interesting and complex fold & thrust belts worldwide, the course is designed to show the participants typical geological control factors in different geodynamic and palaeoenvironmental scenarios.
