Magneto Optical Study Of Cobalt

Abstract. Epitaxial films and ordered arrays of submicron structures of nickel and cobalt ferrites were deposited on Nb doped SrTiO₃ by pulsed laser deposition. X-Ray diffraction and atomic force microscopy showed that the films have a good crystalline quality and smooth surfaces. A larger number of phonon bands was observed in the polarization dependent Raman spectra of the ferrite films than expected for the cubic spinel structures.

Optical and magneto-optical study of nickel and cobalt ...

Spectroscopic ellipsometry and the polar magneto-optical Kerr effect ($1.5 < h\nu < 5.5$ eV) have been used to study the properties of a cobalt ferrite (CoFe₂O₄) single crystal, grown from the flux. The magnitude of the polar Kerr rotation both in-field and in remanence were used to study the polishing action and subsequent etching.

In this study, we discussed the optical properties (Faraday rotation, transmittance and Merit factor) of two samples of magnetic liquids synthesized by co-precipitation and an additional hydrothermal synthesis of cobalt ferrite (CoFe₂O₄) developed according to the protocol developed by R. Massart at the PHENIX laboratory at Pierre and Marie Curie University in the form of ferrofluids.

Among them, cobalt molybdates (CoMoO_4) semiconductor is attractive materials, because of their exclusive properties viz., structural, electro-magnetic, and opto-catalytic properties,,,. The CoMoO_4 is beneficial due to cost effective, non-poisonous and its better electrochemical and optical behavior.

In this work we present core-shell nanowire arrays of gold coated with a nanometric layer of cobalt. Despite the extremely small Co volume, these core-shell nanowires display large magneto-optical activity and plasmonic resonance determined by the geometry of the structure. Therefore, we are able to tune both the plasmonic and magneto-optical response in the visible range.

In this work, we investigated the macroscopic (magneto-)optical response of chemisorbed α -helical polyaniline self-assembled monolayers (SAMs) on a gold and gold-capped-cobalt thin film on Au substrates using spectroscopic ellipsometry and magneto-optical Kerr effect spectroscopy and microscopy.

A magneto-optical study of $\text{Co}_x\text{Fe}_{1-x}\text{Fe}_2\text{O}_4$ nanoparticles is presented, with cobalt molar ratio $0 \leq x \leq 1$. The ferrite nanoparticles were produced using a generic wet-chemical synthesis procedure. Stoichiometric amounts of Fe^{2+} , Fe^{3+} and Co^{2+} salts are dissolved in a non-aqueous polar medium (diethylene glycol). A

coprecipitation reaction with sodium hydroxide produces ferrite nanoparticles with average diameter of 6 nm.

Magneto Optical Study Of Cobalt Ferrite Nanoparticles

Abstract: Cd²⁺ doped cobalt ferrite magnetic nanoparticles with the formula Cd_xCo_{1-x}Fe₂O₄ (x = 0.0, 0.1, 0.2, 0.3, 0.4, 0.5) were successfully synthesized and coated by silica shell. The effects of non-magnetic Cd²⁺ doping and silica coating on structural, magnetic, and optical properties of CoFe₂O₄ nanoparticles had been investigated. XRD patterns confirmed that all samples were found to have a cubic spinel structure with average crystallite sizes 15–43 nm.

Face centered cubic cobalt layer on Au(111): a magneto ...

In diluted magnetic semiconductors (DMS's), the presence of transition metal ions with localized spin moments leads to enhanced magneto-optical (MO) effects. These effects arise from the sp-d exchange interaction between the band electrons and the localized 3d electrons. The sp-d exchange constants $N_{0\alpha}$ and $N_{0\beta}$ and the magnetization determine the size of these effects.

The magneto-optical effects found in the fluorides are connected with spin-flipping of the magnetic sublattices by the external field. This may be due to a significant spin-orbital exchange in states (the final states for the optical transitions responsible for the absorption bands) which respond to the re-establishment of the antiferromagnetic structure by the external field.
