Predicting Precipitates Using Solubility Rules. Some combinations of aqueous reactants result in the formation of a solid precipitate as a product. However, some combinations will not produce such a product. If solutions of sodium nitrate and ammonium chloride are mixed, no reaction occurs. One could write a molecular equation showing a double-replacement reaction, but both products, sodium chloride and ammonium nitrate, are soluble and would remain in the solution as ions.

Solubility Rules. When salt solutions are mixed, two things can happen: 1) no

reaction (all ions remain soluble), or 2) a solid forms (called precipitation). You will examine which salts (positive + negative ions) are soluble and which are insoluble. 1. Gather together: 1 paper grid, 1 overhead (acetate) sheet, two pieces of masking tape. 2.

In this experiment, we will work with precipitation reactions involving ions. Ionic solids dissolve in water by a process known as dissolution. If an appreciable amount of the solid dissolves, it is said to be soluble. The ions are solvated by water, and free to move independently of each other in the solution. When two aqueous solutions of ionic substances are mixed, the mobile

ions in each solution interact with each other.
