Robustness and Evolvability in Living Systems by Andreas ...
To achieve this consistency, organisms must have a balance between robustness and evolvability, that is, between resisting and allowing change in their own internal states . Moreover, they must achieve this balance on multiple time scales, including physiological responses to changes over an individual life and evolutionary responses, in which a population of genomes continually updates its encoded information about past environments and how future generations should respond given that record.

Robustness and Evolvability in Living Systems by Andreas ...
At first, robustness and evolvability appear to be opposites; if most mutations have no effect, then there will be less variation for selection to act on. Indeed, ‘robustness’ mechanisms that prevent genetic change from occurring in the first place, such as proofreading and DNA repair, necessarily impede evolvability . When many mutations occur, but phenotypes are robust to them, populations tend to spread out over a larger region of genotype space.

Robustness and Evolvability in Living Systems: 15: Wagner ...
Evolvability and robustness are both thought essential for the origin and maintenance of complex, well-adapted organisms (Conrad, 1990, Kauffman, 1993, Gerhart and Kirschner, 1997, Wagner, 2005), but these two properties conflict as evolvability depends on the ability to generate new potentially adaptive phenotypes through mutation while robustness depends on the ability to maintain the same phenotype in the face of mutation.

Evolvability and robustness: A paradox restored ...

Robustness in the face of mutation does not increase evolvability in the first sense. In organisms with a high level of robustness, mutations have smaller phenotypic effects than in organisms with a low level of robustness. Thus, robustness reduces the amount of heritable genetic variation on which selection can act.
