This is defined as the energy transfer rate average over many periods of the RF waveform. The simplest waveform to measure is a continuous wave (CW). As the signal is a single frequency steady state waveform, the average power is obvious. For other waveforms the averaging parameters may be of greater importance.

RF Power Measurements: Average, Pulse, Peak Envelope Power ...
Peak power, such as the overshoot of an RF pulse or IQ waveform, is the maximum value over some period of time. The power measurement can be averaged across a time period, such as across a series of RF pulses, yielding the average power. RF power can be integrated over a frequency band, as is the case for many mobile communication signals.

Analysis of DC-RF Dispersion in AlGaIn/GaN HFETs Using RF Waveform Engineering. Abstract: This paper describes how dc-radio-frequency (RF) dispersion manifests itself in AlGaIn/GaN heterojunction field-effect transistors when the devices are driven into different RF load impedances. The localized nature of the dispersion in the I - V plane, which is confined to the l dquokneer dquo region, is observed in both RF waveform and pulsed I - V measurements.

Radio frequency is the oscillation rate of an alternating electric current or voltage or of a magnetic, electric or electromagnetic field or mechanical system in the frequency range from around 20 kHz to around 300 GHz. This is roughly between the upper limit of audio frequencies and the lower limit of infrared frequencies; these are the frequencies at which energy from an oscillating current can radiate off a conductor into space as radio waves. Different sources specify different upper and low
