Asymmetric synthesis is a challenge for the modern-day organic chemist. The widely used asymmetric catalysis using chiral metal complexes often causes problems in dividing the products. The use of potentially toxic metal catalysts is particularly unwelcome in the synthesis

of pharmaceutical substances and reactants in biomedical analysis.

IUPAC as: a chemical reaction in which one or more new elements of chirality are formed in a substrate molecule and which produces the stereoisomeric products in unequal amounts. Put more simply: it is the synthesis of a compound by a method that favors the formation of a specific enantiomer or diastereomer. Enantiomers are stereoisomers that have opposite configurations at every chira
